Secured FTP

To allow optimal security between CarPro Systems and its customers, we offer secured FTP connections from our servers.

Download a client that accepts outgoing SFTP connections. For this example, we use [FileZilla](#) (click to download from CarPro Systems' server).

After installing the application: open the application, go to *file* and click on *site manager*. Here you can create a new FTP connection. Use the following settings:

Host: *customers.carprosystems.com*
Servertype: *FTPS*
Third tab (extra settings): *passive*

And finally enter your business FTP username and password provided by CarPro Systems. You can use your existing account information. If you no longer have this information, please contact us.

If you wish we can add in an extra security measure by only allowing FTP connections to the CarPro Systems FTP server from an IP list that you provided. When needed, you can supply us with this IP list.

If you have any questions and or problems regarding setting up the FTPS connection, feel free to contact our customer [support department](#).

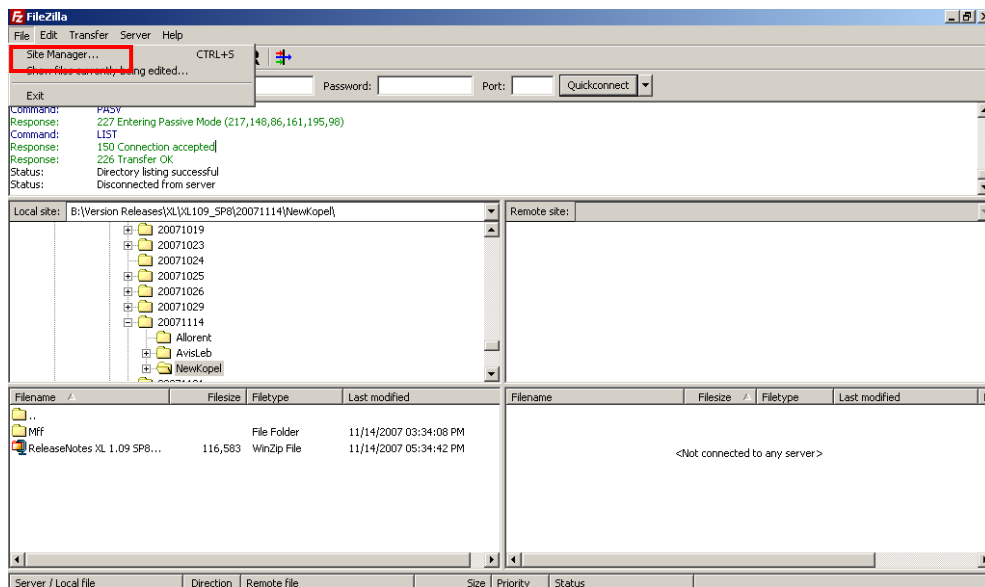

CarPro Systems Offers Secured FTP connection to our Servers

2. Install FileZilla

3. Apply the following settings to connect to FTP

a. Menu -File > Site Manager

b. Create "New Site"
